Periodical title:
South African Medical Journal

Description:
This paper describes an evaluation of a workplace HIV/AIDS peer-educational program. A cross-sectional study of 900 employees was conducted in 2001 across three areas in South Africa and measured the impact of a peer-education program on knowledge, attitudes towards people living with HIV/AIDS, perceptions of risk and condom use. Peer-education had no impact on any outcome. Some 59% of subjects had good knowledge, 62% positive attitude towards people living with HIV/AIDS, 34% reported frequently using condoms, 73% perceived themselves at low risk for infection. Peer education was ineffective and had an opportunity cost, as other more costly programs often include provision of antiretrovirals.
